GE|MENU|AB029 - Redesign Menu Adding Visual Cards

Hypothesis

If we redesign the mobile menu to include visual product cards and category banners with images, we expect to increase product views and final conversion rate because visual elements make the menu more engaging, help users quickly recognize relevant products and categories, and reduce the effort required to discover and navigate to items of interest compared to a text-only menu.

Identified problems:

- The current mobile menu is text-only, which makes it harder for users to quickly identify relevant products or categories.
- Users must rely on reading and exploring multiple pages, increasing friction and slowing product discovery.
- Product pages have high bounce rates, suggesting users who don't find the right product lack clear alternative paths to continue browsing.
- The menu is a high-traffic navigation element, but it is not fully optimized to guide users toward bestsellers or high-converting categories.
- Without visual guidance, users may overlook key products or categories, reducing engagement, product views, and overall conversion opportunities.

What we proposed:

- Redesign the mobile menu to include visual cards with product and category images.
- Replace or complement text-only links with image-based navigation elements.
- Add visual category cards to help users quickly identify and access key sections.
- Use visual hierarchy to make important categories and products more noticeable.
- Keep the menu clean, easy to scroll, and optimized for mobile browsing.

Reasons why

1. **Recognition Heuristic**
   Users click faster when they see products or categories they recognize visually instead of reading text.
2. **Cognitive Load Reduction**
   Visual cards make the menu easier to understand, reducing effort and helping users navigate faster.
3. **Visual Salience Bias**
   Images attract more attention than text, making users more likely to interact with highlighted products and categories.

Measured by

- Product views
- Add-to-cart
- Final Conversion Rate
